

A GENERALIZATION OF DEODHAR'S DEFECT STATISTIC FOR IWAHORI-HECKE ALGEBRAS OF TYPE BC

Gavin Hobbs, Tommy Parisi, Mark Skandera, Jiayuan Wang

Lehigh University

Outline

- (1) Hyperoctahedral group - Coxeter group of type BC
- (2) Bruhat order
- (3) Type-BC Hecke algebra $H_n^{\text{BC}}(q)$
- (4) Star networks
- (5) Path families and defects
- (6) Combinatorial formula for multiplying in $H_n^{\text{BC}}(q)$

The Hyperoctahedral group \mathfrak{B}_n

$\mathfrak{B}_n =$ permutations $w_{\bar{n}} \cdots w_{\bar{1}} w_1 \cdots w_n$ of $\bar{n} \cdots \bar{2} \bar{1} 1 2 \cdots n$ with $w_{\bar{i}} = \overline{w_i}$. Generated by s_0, s_1, \dots, s_{n-1} , subject to relations

$$\begin{aligned} s_i^2 &= e && \text{for } i = 0, \dots, n-1, \\ s_i s_j s_i &= s_j s_i s_j && \text{for } |i-j| = 1, \quad i, j \geq 1, \\ s_0 s_1 s_0 s_1 &= s_1 s_0 s_1 s_0 && \\ s_i s_j &= s_j s_i && \text{for } |i-j| \geq 2. \end{aligned}$$

Inherited action on words $a_{\bar{n}} \cdots a_{\bar{1}} a_1 \cdots a_n$ is

- s_i swaps letters in positions $i, i+1$ and $\bar{i}, \bar{i}+1$,
- s_0 swaps letters in positions $\bar{1}, 1$.

Ex: $s_2 s_1 s_0 (\overline{321123}) = s_2 s_1 (\overline{321\bar{1}23}) = s_2 (\overline{31\bar{2}2\bar{1}3}) = \overline{13\bar{2}2\bar{3}1}$.

Short one-line notation = right-half of one-line notation.

Reversals in \mathfrak{B}_n

The *Reversal* $s_{[a,b]}$ reverses letters $[a, b] := \{a, \dots, b\} \setminus \{0\}$, where $a = \bar{b}$ ($b > 0$) or $0 < a < b$.

Short one-line notation of $s_{[a,b]}$:

- (1) (For $a = \bar{b}$) $\bar{1} \cdots \bar{b} \cdot (b+1) \cdots n$
- (2) (For $0 < a < b$) $1 \cdots (a-1) \cdot b \cdots a \cdot (b+1) \cdots n$

$s_{[a,b]}$ is the maximal element of the parabolic subgroup of \mathfrak{B}_n generated by $\{s_{\max\{0,a\}}, \dots, s_{b-1}\}$.

Ex:

$$s_{[2,4]}(\overline{5432112345}) = \overline{5234114325}.$$

$$s_{[\bar{4},4]}(\overline{5432112345}) = \overline{5432112345}.$$

Bruhat order on \mathfrak{B}_n

For $v, w \in \mathfrak{B}_n$, define $v \leq w$ if some (equivalently, every) reduced expression for w contains a reduced expression for v .

For a maximum element of a parabolic subgroup of \mathfrak{B}_n , define

$$\tilde{C}_w(q) := \sum_{v \leq w} T_v$$

Ex: $\tilde{C}_{s_{[1,3]}}(q) = T_e + T_{s_1} + T_{s_2} + T_{s_1s_2} + T_{s_2s_1} + T_{s_1s_2s_1}$.

$\tilde{C}_w(q)$ belongs to a modified signless Kazhdan-Lusztig basis for $H_n^{\text{BC}}(q)$.

The type-BC Hecke algebra $H_n^{\text{BC}}(q)$

Define $H_n^{\text{BC}}(q) = \mathbb{Z}[q^{\frac{1}{2}}, q^{\frac{-1}{2}}]$ -algebra generated by $T_{s_0}, T_{s_1}, \dots, T_{s_{n-1}}$, subject to relations

$$\begin{aligned} T_{s_i}^2 &= (q-1)T_{s_i} + qTe && \text{for } i = 0, \dots, n-1, \\ T_{s_i}T_{s_j}T_{s_i} &= T_{s_j}T_{s_i}T_{s_j} && \text{for } |i-j| = 1, \\ T_{s_0}T_{s_1}T_{s_0}T_{s_1} &= T_{s_1}T_{s_0}T_{s_1}T_{s_0} \\ T_{s_i}T_{s_j} &= T_{s_j}T_{s_i} && \text{for } |i-j| \geq 2. \end{aligned}$$

For $w = s_{i_1} \cdots s_{i_\ell}$ reduced in \mathfrak{B}_n , define $T_w = T_{s_{i_1}} \cdots T_{s_{i_\ell}}$.

Natural basis: $\{T_w \mid w \in \mathfrak{B}_n\}$.

Fact: $H_n^{\text{BC}}(1) \cong \mathbb{Z}[\mathfrak{B}_n]$.

Star networks

Define the type-BC simple star network $F_{s[a,b]}$ to be the planar network corresponding to the reversal $s[a,b] \in \mathfrak{B}_n$.

Ex: The reversals $s[1,1]$, $s[3,3]$, $s[2,3]$, $s[1,3]$ correspond to

$$\begin{aligned}
 F_{s[1,1]} &= \begin{array}{c} 3 \\ 2 \\ 1 \end{array} \times \begin{array}{c} 1 \\ 1 \\ 2 \\ 3 \end{array}, & F_{s[3,3]} &= \begin{array}{c} 3 \\ 2 \\ 1 \end{array} \bigstar \begin{array}{c} 3 \\ 2 \\ 1 \\ 1 \\ 2 \\ 3 \end{array}, & F_{s[2,3]} &= \begin{array}{c} 3 \\ 2 \\ 1 \\ 1 \\ 2 \\ 3 \end{array} \times \begin{array}{c} 3 \\ 2 \\ 1 \\ 1 \\ 2 \\ 3 \end{array}, & F_{s[1,3]} &= \begin{array}{c} 3 \\ 2 \\ 1 \\ 1 \\ 2 \\ 3 \end{array} \times \begin{array}{c} 3 \\ 2 \\ 1 \\ 1 \\ 2 \\ 3 \end{array}.
 \end{aligned}$$

Define a type-BC star network $F = F_{s[a_1,b_1]} \circ \dots \circ F_{s[a_k,b_k]}$ to be a concatenation of type-BC simple star networks.

Path families in a star network F

Call $\pi = (\pi_{\bar{n}}, \dots, \pi_n)$ a **type-BC path family** in F if:

- (1) π_i is a path from source i on left to some sink on right,
- (2) π covers all edges of F ,
- (3) π_i is a horizontal reflection of $\pi_{\bar{i}}$ for all $i = 1, \dots, n$.

Then $\pi \in \Pi^{\text{BC}}(F)$. Say $\text{type}(\pi) = w$ if π_i ends at sink w_i .

Ex: Consider the following path families in $F = F_{s_{[1,2]}} \circ F_{s_{[1,3]}}$

π_e and π_{213} are **type-BC**, with $\text{type}(\pi) = e$, $\text{type}(\pi') = s_1$. But σ isn't a **type-BC** path family since σ_1 doesn't reflect $\sigma_{\bar{1}}$.

Defects of a path family π

Let $F = F_{S[a_1, b_1]} \circ \dots \circ F_{S[a_t, b_t]}$. Given $\pi \in \Pi^{\text{BC}}(F)$, define a type-BC defect of π to be a triple (π_i, π_j, k) with

- (1) $|i| \leq j$,
- (2) π_i and π_j meet at an internal vertex of $F_{[c_k, d_k]}$ after having crossed an odd number of times.

Let $\text{dfct}^{\text{BC}}(\pi)$ denote the number of type-BC defects of π .

For example, consider the star network and path family

$$F_{[2,2]} \circ F_{[1,1]} \circ F_{[1,2]} \circ F_{[2,2]} = \begin{array}{c} \text{Diagram 1} \\ \text{Diagram 2} \end{array}, \quad \pi = \begin{array}{c} \text{Diagram 3} \\ \text{Diagram 4} \end{array}.$$

The defects of π are $(\pi_{\bar{1}}, \pi_1, 2)$, $(\pi_{\bar{1}}, \pi_2, 3)$, $(\pi_1, \pi_2, 4)$, $(\pi_{\bar{2}}, \pi_2, 4)$, and thus $\text{dfct}^{\text{BC}}(\pi) = 4$.

Graphical representations for $H_n^{\text{BC}}(q)$

The set $\Pi^{\text{BC}}(F)$ associates elements of $\mathbb{Z}[\mathfrak{B}_n]$ and $H_n^{\text{BC}}(q)$ to F . We say that F *graphically represents*

$$\sum_{\pi \in \Pi^{\text{BC}}(F)} \text{type}(\pi)$$

as an element of $\mathbb{Z}[\mathfrak{B}_n]$ and

$$\sum_{\pi \in \Pi^{\text{BC}}(F)} q^{\text{dfct}^{\text{BC}}(\pi)} T_{\text{type}(\pi)}$$

as an element of $H_n^{\text{BC}}(q)$.

Let $\Pi_{w,d}^{\text{BC}}(F) = \{\pi \in \Pi^{\text{BC}}(F) \mid \text{type}(\pi) = w, \text{dfct}^{\text{BC}}(\pi) = d\}$.

Main Result

Thm: Fix a sequence $(s_{[a_1, b_1]}, \dots, s_{[a_k, b_k]})$ of reversals in \mathfrak{B}_n and define the type-BC star network $F = F_{s_{[a_1, b_1]}} \circ \dots \circ F_{s_{[a_k, b_k]}}$. Then we have

$$\tilde{C}_{s_{[a_1, b_1]}}(q) \cdots \tilde{C}_{s_{[a_k, b_k]}}(q) = \sum_{w \in \mathfrak{B}_n} \sum_{d \geq 0} |\Pi_{w, d}^{\text{BC}}(F)| q^d T_w.$$

This combinatorial formula for the coefficients in the natural expansion of such a product of Kazhdan-Lusztig basis elements yields a new procedure for multiplying in $H_n(q)$:

- (1) Represent a product $\tilde{C}_{s_{[a_1, b_1]}}(q) \cdots \tilde{C}_{s_{[a_k, b_k]}}(q)$ by type-BC star network F .
- (2) Consider all possible path crossings to enumerate $\Pi^{\text{BC}}(F)$.
- (3) Each $\pi \in \Pi_{w, d}^{\text{BC}}(F)$ contributes $q^d T_w$ to the product.

Example multiplication in $H_n^{\text{BC}}(q)$

$F = F_{s_1} \circ F_{s_0} \circ F_{s_0}$ represents $(T_e + T_{s_1})(T_e + T_{s_0})(T_e + T_{s_0})$.

There are 8 path families in $\Pi^{\text{BC}}(F)$:

$$\begin{array}{c} \color{red}{2} \quad \color{blue}{2} \\ \color{red}{1} \quad \color{blue}{1} \\ \color{green}{1} \quad \color{green}{1} \\ \color{blue}{2} \quad \color{blue}{2} \end{array} \in \Pi_{e,0}^{\text{BC}}(F),$$

$$\begin{array}{c} \color{red}{2} \\ \color{red}{1} \quad \color{blue}{1} \\ \color{green}{1} \quad \color{green}{1} \\ \color{blue}{2} \quad \color{blue}{2} \end{array} \in \Pi_{s_0,0}^{\text{BC}}(F),$$

$$\begin{array}{c} \color{red}{2} \\ \color{red}{1} \quad \color{blue}{1} \\ \color{green}{1} \quad \color{green}{1} \\ \color{blue}{2} \quad \color{blue}{2} \end{array}$$

$$\begin{array}{c} \color{blue}{2} \\ \color{blue}{1} \quad \color{red}{1} \\ \color{green}{1} \quad \color{green}{1} \\ \color{blue}{2} \quad \color{blue}{2} \end{array} \in \Pi_{s_1,0}^{\text{BC}}(F),$$

$$\begin{array}{c} \color{blue}{2} \\ \color{blue}{1} \quad \color{red}{1} \\ \color{green}{1} \quad \color{green}{1} \\ \color{blue}{2} \quad \color{blue}{2} \end{array} \in \Pi_{s_1 s_0,0}^{\text{BC}}(F),$$

$$\begin{array}{c} \color{blue}{2} \\ \color{blue}{1} \quad \color{red}{1} \\ \color{green}{1} \quad \color{green}{1} \\ \color{blue}{2} \quad \color{blue}{2} \end{array}$$

$$\in \Pi_{s_1 s_0,1}^{\text{BC}}(F),$$

$$\begin{array}{c} \color{blue}{2} \\ \color{blue}{1} \quad \color{red}{1} \\ \color{green}{1} \quad \color{green}{1} \\ \color{blue}{2} \quad \color{blue}{2} \end{array} \in \Pi_{s_1,1}^{\text{BC}}(F).$$

Combining each term gives $(1 + q)(T_e + T_{s_0} + T_{s_1} + T_{s_1 s_0})$.

Example multiplication in $H_n^{\text{BC}}(q)$

$$F = F_{s_{[1,3]}} \circ F_{s_{[2,3]}} \circ F_{s_{[1,2]}} \circ F_{s_{[1,3]}} \text{ represents } \tilde{C}_{s_{[1,3]}}(q) \tilde{C}_{s_{[2,3]}}(q) \tilde{C}_{s_{[1,2]}}(q).$$

To find the natural coefficient of T_e , observe

$$\begin{array}{c} \begin{array}{c} 3 \\ 3 \\ 2 \\ 1 \\ 1 \\ 1 \\ 2 \\ 3 \end{array} \begin{array}{c} \text{---} \\ \diagdown \\ \diagup \\ \text{---} \\ \diagdown \\ \diagup \\ \text{---} \\ \diagdown \\ \diagup \\ \text{---} \end{array} \\ \in \Pi_{e,0}^{\text{BC}}(F), \end{array} \quad \begin{array}{c} \begin{array}{c} 3 \\ 3 \\ 2 \\ 1 \\ 1 \\ 1 \\ 2 \\ 3 \end{array} \begin{array}{c} \text{---} \\ \diagdown \\ \diagup \\ \text{---} \\ \diagdown \\ \diagup \\ \text{---} \\ \diagdown \\ \diagup \\ \text{---} \end{array} \\ \in \Pi_{e,1}^{\text{BC}}(F), \end{array}$$

$$\begin{array}{c} \begin{array}{c} 3 \\ 3 \\ 2 \\ 1 \\ 1 \\ 1 \\ 2 \\ 3 \end{array} \begin{array}{c} \text{---} \\ \diagdown \\ \diagup \\ \text{---} \\ \diagdown \\ \diagup \\ \text{---} \\ \diagdown \\ \diagup \\ \text{---} \end{array} \\ \in \Pi_{e,1}^{\text{BC}}(F), \end{array} \quad \begin{array}{c} \begin{array}{c} 3 \\ 3 \\ 2 \\ 1 \\ 1 \\ 1 \\ 2 \\ 3 \end{array} \begin{array}{c} \text{---} \\ \diagdown \\ \diagup \\ \text{---} \\ \diagdown \\ \diagup \\ \text{---} \\ \diagdown \\ \diagup \\ \text{---} \end{array} \\ \in \Pi_{e,2}^{\text{BC}}(F). \end{array}$$

Therefore the T_e term has coefficient $(1 + 2q + q^2)$.
